

WHAT IS CLAIMED IS:

sub Q1 1. A method for transmitting traffic having
disparate rate components, comprising:

5 receiving a plurality of traffic streams, each traffic
stream including a first component and a reduced rate
second component associated with the first component;

segmenting the first components of the traffic streams
into successive cells; and

10 distributing the second components of the traffic
streams between a defined set of the cells for in-band
transmission of the second components.

15 2. The method of Claim 1, further comprising
substantially evenly distributing the second components of
the traffic streams between the defined set of cells.

20 3. The method of Claim 1, further comprising
segmenting the first component of each traffic stream into
a fixed position in the successive cells.

25 4. The method of Claim 1, wherein the defined set of
cells is a superframe, further comprising transmitting
successive superframes without insertion of intervening
superframe information.

sub Q2 5. The method of Claim 1, wherein distributing the
30 second component of the traffic streams between the defined
set of cells comprises including in each cell the second
component for a portion of the traffic streams such that
the second components for all of the traffic streams are
included within the defined set of cells.

6. The method of Claim 1, wherein the reduced rate second component comprises information received as superframe information. *B*

5 7. The method of Claim 1, wherein the reduced rate second component comprises control information for the first component. *B*

10 8. The method of Claim 1, wherein the first component is a DS-0 and the reduced rate second component is the Channel Associated Signaling (CAS) value for the DS-0.

15 9. The method of Claim 1, wherein the cell is asynchronous transfer mode (ATM) cell.

20 10. The method of Claim 1, wherein the first component is a DS-0, the reduced rate second component is the CAS value for the DS-0, and the cell is an ATM adaption layer (AAL) cell.

11. The method of Claim 10, further comprising repeating included CAS values in each AAL cell. *B*

25 12. The method of Claim 10, further comprising providing a 4 bit sequence count in an AAL header for the AAL cell. *B*

Sub Q3

13. The method of Claim 5, further comprising:
storing a current value for the reduced rate second
components for each traffic stream in a memory; and
retrieving the second components of traffic streams
5 for inclusion in the cells from the memory.

062891.0368

14. A method for reformatting telephony traffic into asynchronous transport mode (ATM) adaption layer (AAL) cells for transmission on a network, comprising:

5 receiving a plurality of telephony streams, each telephony stream including a DS-0 channel and a Channel Associated Signaling (CAS) value for the DS-0 channel;

segmenting the DS-0 channels into successive AAL cells; and

including in each AAL cell the CAS value for a portion of the DS-0 channels such that the CAS values for all of the DS-0 channels are included within a superframe of AAL cells.

15 15. The method of Claim 14, wherein the superframe contains 24 AAL cells. c

16. The method of Claim 14, wherein the superframe contains 16 AAL cells. c/

sub 24

17. A telecommunications signal embodied in a transmission media comprising:

a superframe having a plurality of frames;

5 the frames each comprising a successive segment of a first component for a plurality of traffic streams and a reduced rate second component for a portion of the traffic streams; and

10 the frames in the superframes together comprising the reduced rate second components for all of the traffic streams.

18. A telecommunications signal of Claim 17, the first component comprising a DS-0 and the reduced rate second component comprising the CAS value for the DS-0.

15

sub 25

19. The telecommunication signal of Claim 17, further comprising the successive segments of the first component for the traffic streams having a fixed position in each frame.

20

20. The telecommunications signal of Claim 17, the reduced rate second component comprising superframe information.

25

21. The telecommunications signal of Claim 17, the reduced rate second component comprising control information for the first component.

sub 26

30

22. The telecommunications signal of Claim 17, substantially each frame in the superframe comprising reduced rate second components for a same number of traffic streams.

23. A telecommunications device, comprising:
one or more ports receiving a plurality of traffic
streams, each traffic stream including a first component
and a reduced rate second component associated with the
first component; and

5 a reformatting device operable to segment the first
components of the traffic streams into successive cells and
to distribute the second components of the traffic streams
between a defined set of cells for in-band transmission of
10 the second components.

24. The telecommunications device of Claim 23,
further comprising the reformatting device operable to
substantially evenly distribute the second components of
the traffic streams between the defined set of cells.

25. The telecommunications device of Claim 23,
further comprising the reformatting device operable to
segment the first components of each traffic stream into a
fixed position in the successive cells.

sub 2? 26. The telecommunications device of Claim 23, the
reformatting device operable to include in each cell the
second component for a portion of the traffic streams such
that the second components for all of the traffic streams
are included within the defined set of cells.

27. The telecommunications device of Claim 23,
wherein the first component is a DS-0, the reduced rate
second component is the CAS value for the DS-0 and the cell
is an ATM adaption layer (AAL) cell.
